

Exercise 2.5: Django MVT Revisited

Learning Goals

- Add images to the model and display them on the frontend of your application
- Create complex views with access to the model
- Display records with views and templates

Reflection Questions

1. In your own words, explain Django static files and how Django handles them.
 - Static files are files that are not dynamically generated by the Django server and don't change while the web application is running. Most common examples of static files would be images, scripts, and styles. These static files sit in a directory labeled "static" so Django knows where to retrieve them when they are called using the {% static %} tag.
2. Look up the following two Django packages on Django's official documentation and/or other trusted sources. Write a brief description of each.

Package	Description
ListView	A generic class-based view used to simplify the display of lists, such as a list of objects from a database. It uses a specified model and automatically fetches all objects of that model. Context data is typically made available as object_list or by using a custom name through the context_object_name attribute.
DetailView	Similar to ListView but used to display single-object details from a database. They're typically identified by a primary key and retrieves a single instance of the model specified and passes it to the template. DetailView is ideal for showing more information about a specific entry like a single recipe in our recipe application.

3. You're now more than halfway through Achievement 2! Take a moment to reflect on your learning in the course so far. How is it going? What's something you're proud of so far? Is there something you're struggling with? What do you need more practice with? You can use these notes to guide your next mentor call.
 - So far, the course is going pretty well and I've become more familiar with the structure and how to navigate an application built with the Django framework. One area I think I'm struggling a bit with is being able to tell what has caused an error and how to efficiently fix it. I find that I need to be very methodical with each step as I'm working through the exercise, or I could easily make a mistake and take more time than necessary to figure out what went wrong. I'm sure with more practice, I'll become more comfortable with this and how to efficiently write and test my code.
